Scot Travels
Rate Matrix Business Logic

This document explains how fares are calculated in simple business terms. It describes what affects the price, how the correct rate is chosen, and how the final quote is built.

State-based pricing | Vehicle-specific rates | Progressive slabs | Night surcharge | Tax included in final total

1. What decides the fare?

PICKUP STATE

Which state?

The pickup location decides which state's rate matrix will be used.

VEHICLE

Which vehicle?

Each vehicle has its own separate rate inside the selected state.

JOURNEY DETAILS

What extras?

Miles, stops, meet & greet, pickup time, and tax all affect the final fare.

2. Setup order before pricing can work

STEP 1

Create vehicle

A vehicle is created once with its base details, such as name, code, seats, luggage, and image.

Then

STEP 2

Create state

A state is created so pricing can be managed separately by region.

Then

STEP 3

Link vehicle to state

Inside that state, the admin selects the vehicle and creates its rate matrix.

Ready for pricing

The same vehicle can be reused across multiple states, but each state keeps its own separate pricing for that vehicle.

3. Fare selection flow

STEP 1

User enters route

Pickup, drop-off, and optional stops are added.

STEP 2

System finds state

Pickup location is matched to the correct active state.

STEP 3

Rates load by vehicle

Only active vehicle rates for that state are used.

STEP 4

Fare is calculated

Distance slabs and extra fees are applied.

STEP 5

Vehicle options are shown

Customer sees one quote option per vehicle.

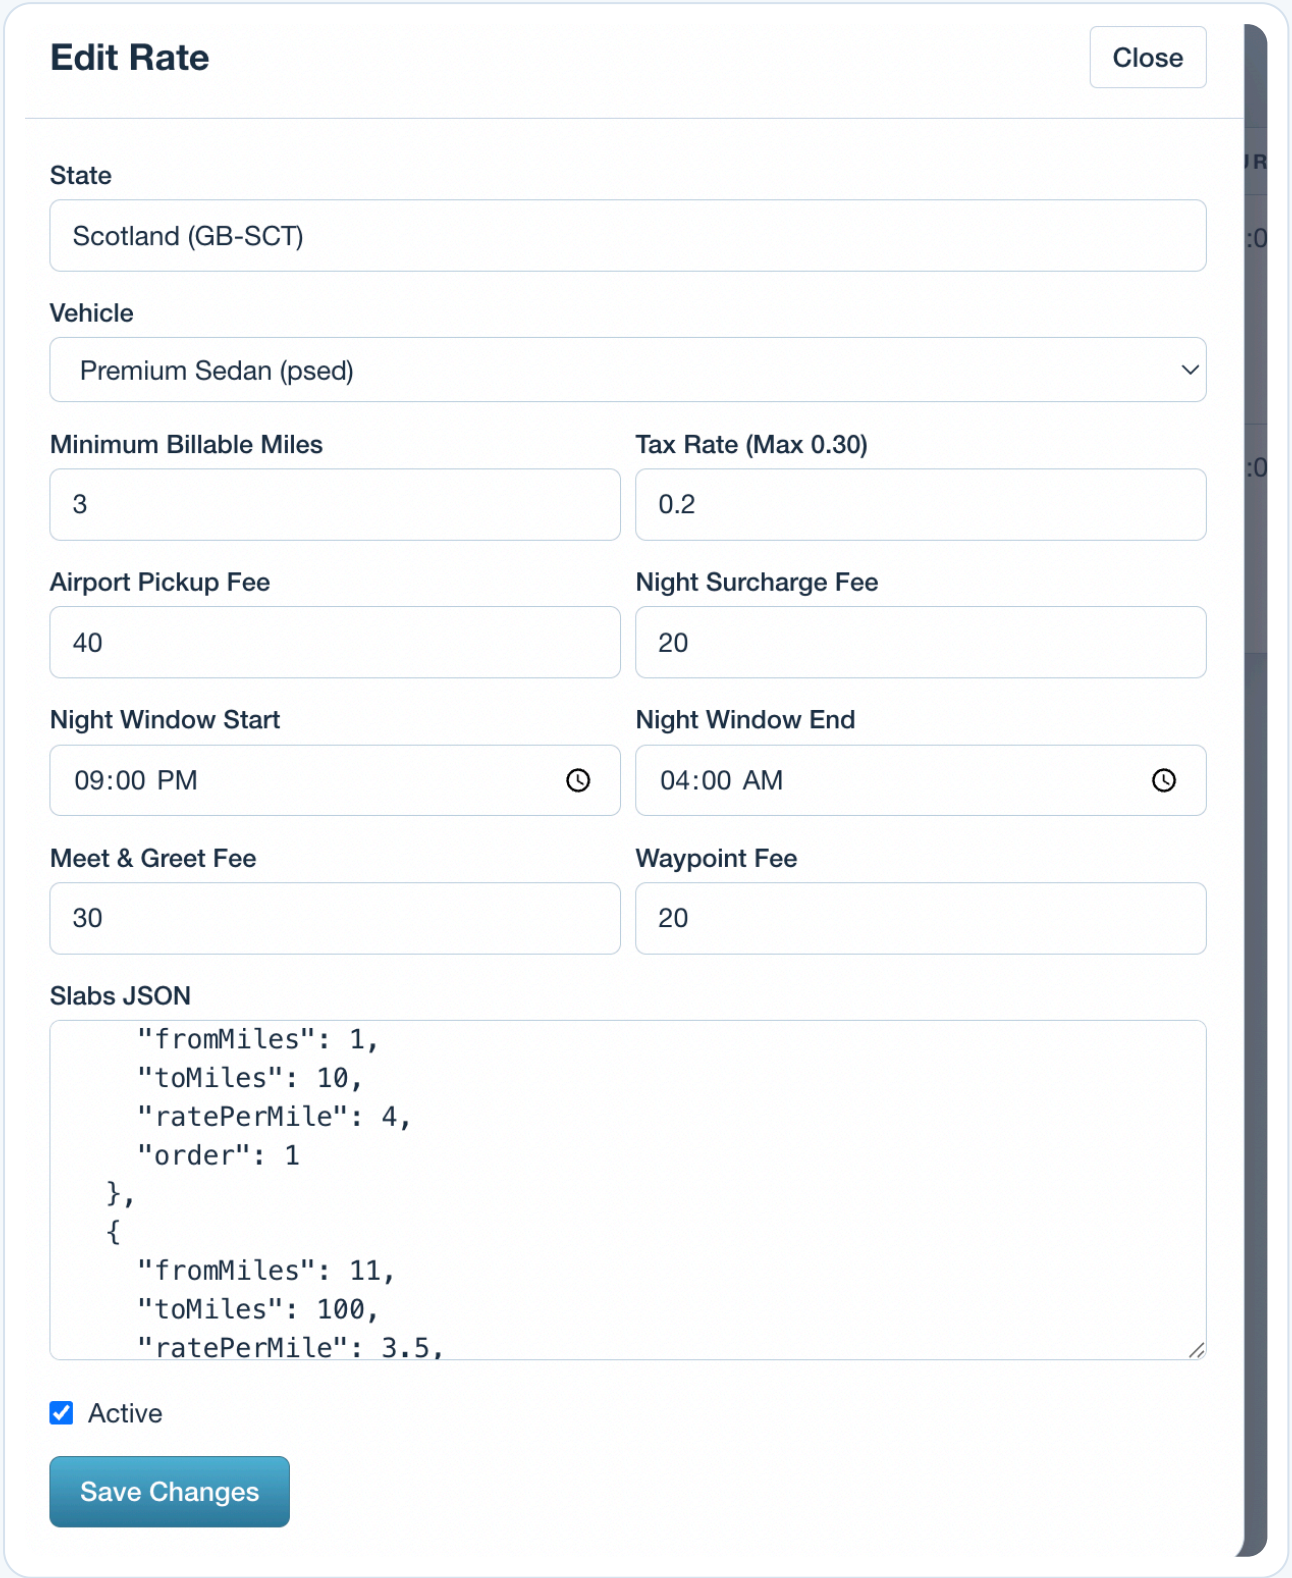

STEP 6

Customer selects one

Selected vehicle price is carried forward to booking.

4. How the mileage charge works

Mileage is charged using **progressive slabs**. This means one trip can use more than one rate band. It does **not** use a single flat rate for the full journey.

EXAMPLE SLAB SETUP

1-10 miles		£4.00 / mi
11+ miles		£3.50 / mi

Business meaning: if a journey is 12 miles, the first 10 miles are charged at the first slab, and only the remaining 2 miles are charged at the second slab.

5. Minimum billable miles

RULE

The system compares two values

- Actual route miles
- Minimum billable miles

RESULT

The higher value is charged

If actual miles are below the minimum, the minimum still applies.

Example: if the route is 2.4 miles and the minimum billable miles are 3, the fare will be calculated on 3 miles.

6. Extra charges that can be added

ALWAYS OR CONDITIONALLY ADDED

- **Airport pickup fee** - flat amount from the selected rate
- **Meet & greet fee** - only if customer selects meet & greet
- **Waypoint fee** - charged per stop added to the trip

TIME-BASED

- **Night surcharge** - flat amount applied only if pickup time falls inside the night window
- **Tax** - added after subtotal is prepared

7. Night surcharge logic

WHAT IS CONFIGURED

Night hours

Example: **21:00 to 04:00**

WHAT HAPPENS

If pickup falls inside this window

The configured night surcharge fee is added once to that journey.

This is a fixed extra charge. It is not currently a percentage and it is not a multiplier.

8. Return journey logic

OUTBOUND

Miles, stops, pickup time, and extras are calculated for the first leg.

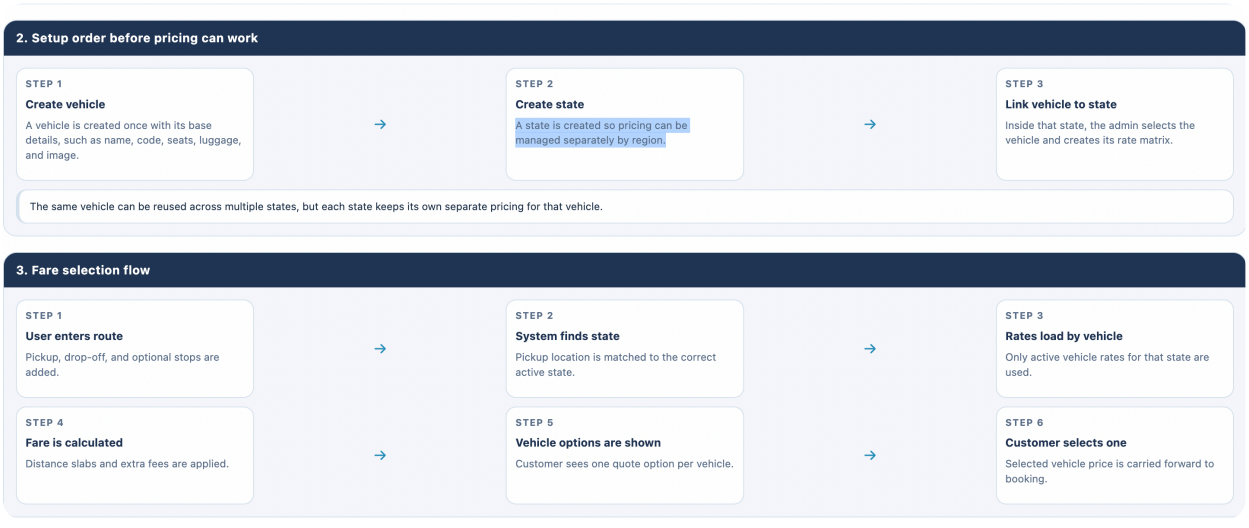

INBOUND

The return leg is priced separately using its own miles, stops, pickup time, and extras.

Final return fare = **Outbound total + Inbound total**

9. Visual price breakdown example

Distance charge	**£47.00**
Airport pickup fee	**£8.00**
Meet & greet fee	**£12.00**
Waypoint fee	**£12.00**
Night surcharge	**£20.00**
Subtotal	**£99.00**
Tax	**£19.80**
Final total	**£118.80**

10. Key business rules

- Rates are managed separately for each state.
- Each state can have different pricing for the same vehicle.
- Only one rate entry is allowed per state and vehicle combination.
- Only active states, active rates, and active vehicles are used in quotes.
- Slabs must cover mileage continuously from 1 mile onward.
- Stops increase the fare through waypoint fees.
- Night pickup can increase the fare through a flat surcharge.
- Tax is added after the subtotal is prepared.
